

PRESS RELEASE

Goodbye regular mops, hello K-Mop 46: the new scrubber dryer from Kärcher

Perfect choice when space is tight

Dällikon, January 2026 – Make light work of cleaning floors in heavily cluttered areas – with the K-Mop 46 from Kärcher. The upright design of the scrubber dryer makes it as manoeuvrable as a mop, delivering excellent cleaning performance and reducing the physical effort required by the user when cleaning. It also delivers in terms of ergonomics: the height-adjustable handle allows cleaners to adjust the K-Mop to their height, so that they aren't forced into the wrong posture while cleaning. The operating concept is intuitive and language-neutral for ultra-simple handling. The plastic components, excluding accessories, are made from 28% recycled material.

While developing the K-Mop, Kärcher paid close attention to the details in a bid to lighten the load on the user. The height-adjustable handle represents a clear benefit: shorter people can keep their hand weight low by adjusting the working angle, while taller users can adjust the angle to their stride length. With its working width of 46 cm, the K-Mop can deliver a high area performance for efficient work. A working light is also available to illuminate darker areas, such as when cleaning in washrooms or under tables.

During the cleaning process, the fresh water travels from the 4-litre fresh water tank located on the handle part down into the waste water tank of the machine, reducing the weight of the top section as cleaning progresses. The tanks are easy to remove from the machine, so they can be fully emptied and rinsed. Thanks to the residual emptying, the inside walls of the tank dry particularly well, which is important for strict hygiene requirements especially in the healthcare sector. For safe filling – for example, at a sink – the fresh water tank has both an opening and a filling hose. Detergent can be carried along in a holder and topped up as and when necessary.

KÄRCHER

PRESS RELEASE

The language-neutral operating concept makes the machine really intuitive to handle. The K-Mop has an on/off switch, a button to regulate the water flow as well as a button to activate or deactivate the eco!mode. An LED ring on the top of the machine displays relevant information via a colour coding system: green indicates everything is OK, blue indicates eco!mode is active, orange indicates that the waste water tank is almost full and/or the battery is almost empty, and red indicates either an empty battery or a fault. Additionally to this, the water volume and remaining runtime are shown on a compact display.

If the K-Mop is required to be brought along as part of a larger cleaning operation, suitable brackets are available for the large B 260 RI scrubber dryer and the Flexomate cleaning trolley from Kärcher. Furthermore, the compact scrubber dryer can be equipped with the Kärcher Plug-In Connect module. This allows a localization of the product; tracking of operating hours and many more features via Krächer Equipment Management. The K-Mop is operated with the 36 V batteries from the Kärcher Battery Universe.
